
GHOST CUSTOMER AI

The AI that becomes your customer before your customer becomes your problem.

A multi-agent platform that simulates hundreds of customers before launch.

Companies find out too late.

Today, a business learns what's broken on its website only AFTER customers:

leave bad reviews / open support tickets / cancel / ask for refunds / stop buying.

By then the ad spend is gone and the customers are lost.

Existing AI tools are reactive - they answer questions only after the problem occurs.

Every landing page is a black box.

You ship it, then wait weeks for real traffic, heatmaps and churn data to tell you what failed.

What if you could meet your customers - and watch them judge you - before they are real?

We open the black box first.

Ghost Customer AI becomes the customer.

We spin up hundreds of AI-generated virtual customers ('ghosts') that browse your site like real prospects.

Each ghost reads your pricing, FAQs, features and onboarding, asks the hard questions, and reports exactly where it got confused, where it hesitated, and what objection killed the deal.

You watch it live, then receive a board-ready executive report - before one real customer hits the page.

This is NOT a chatbot.

Reactive chatbots: wait for a customer to ask -> answer after the damage is done -> one chat at a time.

Ghost Customer AI: becomes hundreds of customers -> finds problems before launch -> simulates your whole market at once.

A chatbot talks to your customer. We become your customer.

From a URL to insight in 7 steps.

1. Enter a website URL
2. AI crawls and analyzes the business
3. Generates hundreds of customer personas
4. Runs the customer simulation swarm
5. Sales and Support agents stress-test the experience
6. Detects revenue leaks and churn risks
7. Delivers an executive report

The Customer Swarm.

12 to 500 AI personas across 10 archetypes:

Startup Founder, CTO, Product Manager, Agency Owner, Student,

Small Business Owner, Enterprise Buyer, Operations Manager, HR Manager, Freelancer.

Each persona returns: interest, confusion, purchase probability, support dependency, churn risk,
and a verdict - Convert / Maybe / Churn Risk / Bounce - rendered as a living, rotating swarm.

A coordinated 8-agent brain.

Website Analyzer -> Persona Generator -> Customer Simulation Swarm

-> Sales Agent || Support Agent -> Revenue Leak Agent -> Insight Agent -> Report Generator

Orchestrated with LangGraph (Python) and mirrored in a TypeScript engine. Two paths, identical contract.

Eight ways to find problems first.

- Conversion risk engine
- Sales objection mining
- Support stress test
- Revenue leak quantification (with \$ impact)
- Churn risk segmentation
- Competitor Battle Arena (you vs a rival)
- Pricing Time Machine
- Executive report (PDF / Markdown export)

What a run reveals.

For a typical SaaS site, the swarm reports:

'67% of simulated customers were confused about pricing.'

'Enterprise buyers cannot find security / SSO information.'

'No free tier - self-serve buyers bounce.'

'Estimated +15% conversion uplift if the top fixes ship.'

Fix it before you pay for traffic.

Improve conversion, reduce churn, close support gaps, win competitive deals, and price with confidence - all before spending a dollar on acquisition. A digital twin of your customer base, on demand.

Production-quality, demo-proof.

Frontend: Next.js 15, React 19, TypeScript, Tailwind, Framer Motion, Recharts.

AI: Gemini 2.5 Flash | Agents: LangGraph + FastAPI | Crawl: Firecrawl.

Data: Supabase Postgres + pgvector. Deploy: Vercel (web) + Render (engine).

Runs with ZERO API keys on a deterministic mock engine - the full demo always works.

Meet your customers before reality does.

The AI that becomes your customer before your customer becomes your problem.
